# Monash University

## Semester One Mid Semester Test 2018

### Faculty of Information Technology

**EXAM CODES:** FIT2004 (Mid-semester Test T2)  
**TITLE OF PAPER:** Algorithms and Data Structures  
**TEST DURATION:** 45 minutes  
**READING TIME:** 5 minutes

***THIS PAPER IS FOR STUDENTS STUDYING AT:***

- |                                    |   |  |  |  |

During an exam, you must not have in your possession, a book, notes, paper, electronic device/s, calculator, pencil case, mobile phone or other material/item which has not been authorised for the exam or specifically permitted as noted below. Any material or item on your desk, chair or person will be deemed to be in your possession. You are reminded that possession of unauthorised materials in an exam is a discipline offence under Monash Statute 4.1.

**No examination papers are to be removed from the room.**

**AUTHORISED MATERIALS**

<b>CALCULATORS</b>	<input type="checkbox"/> YES	<input checked="" type="checkbox"/> NO
<b>OPEN BOOK</b>	<input type="checkbox"/> YES	<input checked="" type="checkbox"/> NO
<b>SPECIFICALLY PERMITTED ITEMS</b>	<input type="checkbox"/> YES	<input checked="" type="checkbox"/> NO

This page is intentionally left blank. You may write your answers here if more space is needed.

## INSTRUCTIONS

- You must answer ALL the questions.
- Answers to each question should be in the space DIRECTLY BELOW the questions and (if required) on the blank page overleaf of each question.

### General exam technique

Do not throw marks away by **not** attempting all questions. Suppose you get 7/10 on a question for a 20 minutes effort. Spending another half hour on the same question gets *at most* 3 more marks. On the other hand, were you to spend that time on a new question, you might get another 10 marks.

Answer the question that is asked of you. If the question asks for Insertion sort, do not write Quick-sort – this only wastes your time.

Do not write un-necessarily long answers. This wastes your valuable exam time. The question will specifically ask for the information required. Therefore, do not include the information that is not specifically asked for. If asked to justify your answer, provide a clear, logical and concise reasoning.

You do not have to attempt the questions in order. Some questions require less work but may be worth more marks. Carefully read the paper to decide the order in which you should attempt the questions based on the marks associated with each question and whether you know the answer or not.

Best of Luck!

**Do not write anything in this table. It is for office use only.**

Question	Points	Score
1	8	
2	6	
3	4	
4	6	
Total:	24	

This page is intentionally left blank. You may write your answers here if more space is needed.

1. This question is composed of short questions. Write your answers to each of these questions in no more than a few lines.

(a) (2 marks) What are the space complexity and auxiliary space complexity of insertion sort? Give brief reasoning.

(b) (2 marks) Consider the Python function shown below which returns the number of times `item` appears in `myList`. Write a loop invariant which holds at the end of each iteration of the while loop (write next to `#INVARIANT`). Using this loop invariant, show that the algorithm returns correct count of `item` in `myList`.

`# this function returns how many times the item appears in myList`

```
def countItem(myList, item):
    count = 0
    i = 0
    while i < len(myList):
        if myList[i] == item:
            count += 1
        i += 1

    #INVARIANT:

    return count
```

This page is intentionally left blank. You may write your answers here if more space is needed.

- (c) (2 marks) What is the worst-case time complexity of searching in Cuckoo hashing? Give brief reasoning.

- (d) (2 marks) Define balance factor of a node in an AVL Tree. What must be the balance factor for every node in a binary search tree so that it can be called an AVL tree?

This page is intentionally left blank. You may write your answers here if more space is needed.

2. (a) (3 marks) Assume that you have already implemented an efficient Quickselect algorithm which, given a value  $k$ , finds  $k$ -th smallest number in an unsorted array in  $O(N)$  worst-case time complexity. Assume that you also have an algorithm for partitioning (as shown in class) which partitions the array using a pivot  $p$  such that all numbers smaller or equal to  $p$  are on its left in the array and all numbers greater than  $p$  are on its right. Using the Quickselect and partitioning algorithm, write a Quicksort algorithm that runs in  $O(N \log N)$  in the **worst-case**.

- (b) (3 marks) Justify why your Quicksort algorithm in part(a) has  $O(N \log N)$  time complexity in the worst-case. If you were unable to write Quicksort algorithm above, you may assume that a correct implementation of Quicksort in part(a) is available for your analysis.

This page is intentionally left blank. You may write your answers here if more space is needed.

3. (a) (3 marks) Consider the Python function shown below. Write its recurrence relation for time complexity and solve it. Also, write its time complexity based on the solution to recurrence relation.

```
def mystery(n):  
    if n == 0:  
        return 0  
    else:  
        value = 0  
        for i in range(n):  
            value += i  
        return value + mystery(n-1)
```

- (b) (1 mark) What is the space complexity of the `mystery(n)` function. Give a brief reasoning.

**This page is intentionally left blank. You may write  
your answers here if more space is needed.**

4. (a) (2 marks) Assume that you have a suffix trie for a string. Briefly describe how would you find the longest repeated substring in it. For example, the longest repeated substring in **MISSISSIPPI** is **ISSI**. What is the worst-case time complexity of your approach and why?

- (b) (2 marks) Assume that you have a suffix trie for a string. Briefly describe how can you use it to find the most frequent character. E.g., if the string is **REFERRER**, the most frequent character is **R** which appears 4 times in the string. What is the time complexity and why?

- (c) (2 marks) What is the space complexity of a suffix trie and why?

**This is the end of the test.**
